Perfection from the bottom up! Â .Evidence for inhibition of estrogen and thyroid hormone receptors in human breast cancer. Two distinct classes of nuclear receptors for sex steroid hormones have been characterized: the estrogen receptor (ER) and the androgen receptor (AR). In this study we measured the levels of estrogen receptors and thyroid hormone receptors in various human breast cancers. The estrogen receptor content was measured using the isotope dilution technique (IDT). Whereas the androgen receptor content was determined by the hormone receptor content was measured using the isotope dilution technique (IDT). Whereas the androgen receptor content was determined by the charcoal plate assay (CPA). The number of ER and AR per cell was determined by the IDT and 2.1 in the CPA. The total number of the ER was 3.15/cell in the IDT and 1.8 in the IDT and 1.12 (CPA). Using specific antibodies to the ER or the AR we were able to inhibit the binding of the receptor at the concentrations used in our study, thereby demonstrating that the effects we measured were of receptors as well as of contaminants.

Immunocytochemistry, performed with the same antibodies, showed that the anti ER did not crossreact with the other steroid hormone receptors known at present. It is concluded that there are a large number of estrogen and androgen receptors preast carcinoma cell. The role of the ER/AR ratio in the biology of the tumor is discussed.Q: how to use map on list of objects with map.reduce. here's the mongoose schema let studentSchema = new mongoose.Schema({ name: { type: String, unique: true, }, level: { type: Number, }, iCalendar: '2017-03-27' }, { iCa
