Haykin 1983, IEE Communication Systems: An Introduction to Theory and. The goal of this text is to develop basic principles and applications of communication systems in an intuitive format. The text is comprised of four chapters, each presented in an intuitive format, with clear examples and applications. Chapters 1, 2, and 3 focus on general aspects of communication systems, and Chapter 4 focuses on a particular type of modulation, namely amplitude-shift keying, and the demodulation. In addition to a comprehensive development of basic principles, Chapter 4 presents the theory of equalization, an important filter design technique. A dramatic example of the effects of this technique is presented in the chapter, and many more examples are found throughout the book. Applications of analog and digital communication systems are presented in the second section. The third section includes the theory of mathematical communication systems, which is intended to give the student the tools to design and analyze communication systems. This section makes no claim of offering an exhaustive list of communication systems. The last two chapters treat a real-world communication system, namely a transatlantic submarine cable system. These two chapters are in the same style as the other chapters. They introduce students to many types of communication systems, and then return to concepts that were initially introduced in Chapters 1 and 2.
